# Identity of the substance

## Name and other identifiers of the substance

**Table 1: Substance identity and information related to molecular and structural formula of the substance (Source: ECHA, 2023)**

<b>Name(s) in the IUPAC nomenclature or other international chemical name(s)</b>	1,2-dihydroxy-9,10-dihydroanthracene-9,10-dione
<b>Other names (usual name, trade name, abbreviation)</b>	1,2-dihydroxy-9,10-anthraquinone; 1,2-dihydroxyanthracene-9,10-dione 1,2-Dihydroxyanthraquinone Alizarin Mordant Red 11
<b>ISO common name (if available and appropriate)</b>	Pigment Red 83
<b>EC number (if available and appropriate)</b>	200-782-5
<b>EC name (if available and appropriate)</b>	N/A
<b>CAS number (if available)</b>	72-48-0
<b>Other identity code (if available)</b>	N/A
<b>Molecular formula</b>	C <sub>14</sub> H <sub>8</sub> O <sub>4</sub>
<b>Structural formula</b>	
<b>SMILES notation (if available)</b>	OC1=C(O)C2=C(C=C1)C(=O)C1=CC=CC=C1C2=O

<b>Molecular weight or molecular weight range</b>	240.21 g/mol
<b>Information on optical activity and typical ratio of (stereo) isomers (if applicable and appropriate)</b>	N/A
<b>Description of the manufacturing process and identity of the source (for UVCB substances only)</b>	N/A
<b>Degree of purity (%) (if relevant for the entry in Annex VI)</b>	N/A

## 1.1 Composition of the substance

**Table 2: Constituents (non-confidential information)**

<b>Constituent (Name and numerical identifier)</b>	<b>Concentration range (% w/w minimum and maximum in multi-constituent substances)</b>	<b>Current MCL on GB MCL list (if applicable)</b>
Pigment Red 83	100%	No current entry

**Table 3: Impurities (non-confidential information) if relevant for the classification of the substance**

No impurities relevant for classification

<b>Impurity (Name and numerical identifier)</b>	<b>Concentration range (% w/w minimum and maximum)</b>	<b>Current MCL on GB MCL list (if applicable)</b>	<b>The impurity contributes to the classification and labelling?</b>
N/A	N/A	N/A	N/A

**Table 4: Additives (non-confidential information) if relevant for the classification**

No additives relevant for classification

<b>Additive (Name and numerical identifier)</b>	<b>Function</b>	<b>Concentration range (% w/w minimum and maximum)</b>	<b>Current MCL on GB MCL list (if applicable)</b>	<b>The additive contributes to the classification and labelling?</b>
N/A	N/A	N/A	N/A	N/A

## 2. Proposed mandatory classification and labelling

**Table 5: Proposed mandatory classification and labelling according to the GB CLP criteria**

<b>Hazardous to the aquatic environment</b>	Not assessed	No
<b>Hazardous to the ozone layer</b>	Not assessed	No

### 3. History of the classification and labelling

Pigment Red 83 does not have an existing entry on the GB MCL list and has not been considered in the GB MCL or EU CLH processes to date. In the EU, 73 notifiers have submitted self-classifications for this substance to ECHA's Classification and Labelling Inventory<sup>1</sup>. A breakdown of these notifications is provided below:

39 notifiers have classified as Acute Tox. 4 (H302).

19 notifiers have classified as Skin Irrit. 2 (H315); Eye Irrit. 2 (H319).

4 notifiers have classified as Eye Irrit. 2 (H319).

2 notifiers have classified as Acute Tox. 4 (H302) and Eye Irrit. 2 (H319).

1 notifier has classified as Skin Sens. 1 (H317); Eye Dam. 1 (H318) and Aquatic Chronic 1 (H410) with an M-factor of 1.

8 notifiers have not classified.

---

## 4. Justification that action is needed

The Health and Safety Executive, in its capacity as the Agency for UK REACH, has prepared a proposal to restrict certain hazardous substances in inks used for tattooing and permanent makeup (PMU) in accordance with Article 69(1) of UK REACH<sup>2</sup>.

The proposed restriction applies to substances that have mandatory classification for various hazards, including skin sensitisation (H317). It also applies to substances that are prohibited for use in cosmetic products under Regulation (EC) No 1223/2009 of the European Parliament and of the Council on cosmetic products (as amended) (hereafter referred to as the Cosmetic Products Regulation). HSE considered if certain substances, which are brought into scope because they are listed in Annex II of the Cosmetic Products Regulation, should be derogated from the restriction. Annex II of the Cosmetic Products Regulation prohibits the use of these substances in hair dyes. However, as they are also listed in Annex IV of the Cosmetic Products Regulation, they are permitted for use as colourants in some other cosmetic products. HSE has therefore reviewed the available hazard information on these substances and determined that for two of them (Pigment Red 83, CAS 72-48-0; and Solvent Violet 13, CAS 81-48-1) there is a potential concern for skin sensitisation. A mandatory classification for skin sensitisation (H317) would bring the substances into scope of the proposed restriction.

Therefore, HSE as the Agency for GB CLP (hereafter referred to as 'the Agency') has prepared this targeted report to propose the mandatory classification and labelling of Pigment Red 83 for skin sensitisation. The substance has not been included in the proposed restriction derogation.

---

<sup>2</sup> [Restrictions - HSE](#)

## 5. Identified uses

Pigment Red 83 is used in the textile industry for fabrics, textiles and apparel (ECHA, 2023).

## 6. Data sources

The data used for this report comes from the publicly available ECHA dissemination site (ECHA, 2023).

The Lhasa Derek Nexus skin sensitisation defined approach ITSv1 1.0 was used to conclude on sub-categorisation. This approach is outlined in OECD Guideline 497.

## 7. Physicochemical properties

**Table 7: Summary of physicochemical properties (source: ECHA, 2023)**

Property	Value	Reference	Comment (e.g., measured or estimated)
<b>Physical state at 20°C and 101,3 kPa</b>	Yellow solid substance	Anon (2017)	Visual inspection Observation made during water solubility test GLP
<b>Melting/freezing point</b>	289-290 °C	Lide, (1993)	No method/guideline specified Non GLP

## **8. Evaluation of physical hazards**

Not assessed.

## 9. Toxicokinetics (absorption, distribution, metabolism and excretion)

No experimental toxicokinetic data are available. The physicochemical properties of substances can inform on their potential to be absorbed dermally. Moderate octanol-water partition coefficient ( $\log P_{ow}$ ) values between -1 and 4 and relatively low molecular weights (MW) below 500 g/mol are favourable for absorption.

The substance's  $\log P_{ow}$  of 2.91 and MW of 240.21 g/mol indicate that dermal absorption is likely.

## 10. Evaluation of health hazards

### 10.1 Acute toxicity – oral route

Not assessed.

### 10.2 Acute toxicity – dermal route

Not assessed.

### 10.3 Acute toxicity – inhalation route

Not assessed.

### 10.4 Specific target organ toxicity – single exposure (STOT SE)

Not assessed.

### 10.5 Skin corrosion/irritation

Not assessed.

### 10.6 Serious eye damage/eye irritation

Not assessed.

### 10.7 Respiratory sensitisation

Not assessed.

### 10.8 Skin sensitisation

The skin sensitisation potential of Pigment Red 83 has been tested in two GLP-compliant mechanistic studies based on recently-developed and internationally validated test protocols: *in chemico*, direct peptide reactivity assay (DPRA; OECD TG 442C (OECD, 2023a)); and *in vitro*, human cell line activation test (h-CLAT; OECD TG 442E (OECD, 2023b)).

The DPRA and h-CLAT each address a specific key molecular event (KE) defined in the adverse outcome Pathway (AOP) for skin sensitisation (AOP:40<sup>3</sup>; OECD, 2014), specifically, covalent binding to proteins (the molecular initiating event (MIE) / key event (KE) 1) and activation of dendritic cells (KE3).

**Table 8: Summary of available studies on skin sensitisation (source: ECHA, 2023)**

Method, guideline, deviations if any	Test system	Test substance	Concentration levels, duration of exposure	Results

1	CD86	NA	Negative
2	CD86	56.03	> 150
1	CD54	46.69	> 200
2	CD54	39.91	> 200

### 10.8.1 Short summary and overall relevance of the provided information on skin sensitisation

The skin sensitising potential of Pigment Red 83 was investigated in two modern GLP- and OECD-compliant *in chemico* and *in vitro* assays, the direct peptide reactivity assay (DPRA; OECD TG 442C) and the human cell line activation test (h-CLAT; OECD TG 442E), respectively. The purity of the test substance was not reported for either study, however the Agency still considers the studies to be suitable for classification purposes.

In the DPRA, the initial pre-experiment investigated the solubility of the substance and determined that dimethylformamide (DMF) was the most appropriate solvent to be used for the main study. The test substance was then incubated with either cysteine or lysine, in accordance with the relevant OECD test guideline (TG 442C), and subsequently analysed by HPLC to quantify the mean peptide depletion for each of the aforementioned two peptides.

Owing to the observed co-elution of the test substance with one of the peptide analytes, lysine, the authors used a prediction model based solely on cysteine depletion, as per OECD TG 442C. This showed a moderate peptide reactivity of 80.95%, defined as a positive result.

The *in vitro* h-CLAT study was performed in accordance with OECD TG 442E on the monocytic leukaemia cell line, THP-1. Cell cultures were exposed for 24 hours to 8 concentrations of the test substance.

An initial assay was conducted to identify suitable concentrations of Pigment Red 83 for the main test. A concentration range of 18.76 to 67.23 µg/mL was subsequently used in the main experiment. The main experiment demonstrated significant upregulation of cell surface markers CD86 and CD54 above the defined thresholds of 150% and 200% for each biomarker, respectively, quantified by fluorescence-activated cell sorting (FACS) analysis in two independent experimental repeats.

CD54 was upregulated up to 446% and 1845% in each of the two repeats, respectively. The upregulation above the threshold (200%) was observed at concentrations starting at 46.69 µg/mL and 38.91 µg/mL in the first and second repeats, respectively. With regard to CD86, while the first repeat did not show significant upregulation of this marker, in the second repeat it was upregulated up to 352%; concentrations of 56.03 µg/mL and 46.69 µg/mL resulted in upregulation over the defined threshold (150%). The positive control, 2,4-dinitrochlorobenzene (DNCB), and solvent and cell culture-medium controls all performed within the acceptability range.

Positive observations of upregulation of CD54 in each of the two repeats, and a positive observation of upregulation of CD86 in the second repeat, jointly satisfy the criteria laid out in OECD TG 442E for the h-CLAT prediction to be considered positive.

Integration of information from the DPRA and h-CLAT enables hazard identification with respect to skin sensitisation, i.e., allows discrimination between skin sensitisers and non-sensitisers (GB CLP Cat 1 and no classification, respectively) by application of the so-called “2 out of 3” (2o3) defined approach (DA). However, this DA does not allow for a potency sub-categorisation and differentiation between Cat 1A and Cat 1B.

OECD Guideline 497 on Defined Approaches for Skin Sensitisation (June 2021) provides data interpretation procedures to interpret *in chemico* (KE1), *in vitro* (KE3) and *in silico* predictions, allowing a distinction between GB CLP skin sensitisation sub-categories 1A and 1B. Therefore, the Agency has used ITSv1 of this DA through use of the DPRA and h-CLAT results together with Lhasa Limited's Derek Nexus Skin Sensitisation Defined Approach ITSv1 1.0<sup>4</sup>. This approach resulted in a prediction of Skin Sensitisation Category 1B (overall score of 5; see Annex I).

Combined, the DPRA and h-CLAT predictions indicate a hazard classification for Pigment Red 83 as a skin sensitiser. Additional application of the *in silico* prediction model Derek Nexus (i.e. the ITSv1 DA) allows determination of its potency.

---

<sup>4</sup> [Lhasa Limited's Defined Approach](#)

### 10.8.2 Comparison with the GB CLP criteria

Currently, the GB CLP criteria for skin sensitisation are based on animal and human data. However *in silico*, *in vitro* and *in chemico* data are still relevant, and can be used for classification as part of a weight-of-evidence assessment. The United Nations Globally Harmonised System of Classification and Labelling of Chemicals (UN GHS, on which GB CLP is based) is being revised to take account of the new approaches that can be used to predict skin sensitisation hazard and potency.

The fixed data interpretation procedure presented in OECD Guideline 497 (ITSv1) provides a defined approach to predict skin sensitisation hazard and potency from DPRA and h-CLAT experimental data together with a Derek Nexus prediction. This approach results in a prediction with high confidence of skin sensitisation Category 1B for Pigment Red 83, in accordance with Table A2.2 of OECD Guideline 497 (scenario 1: all of the information sources, i.e. *in chemico/in vitro* outcomes, are applicable and can be considered (as prescribed in each individual assay) and the *in silico* prediction is in domain).

### 10.8.3 Conclusion on classification and labelling for skin sensitisation

The available *in chemico* and *in vitro* experimental data integrated with *in silico* prediction using the ITSv1 DA indicates that **Pigment Red 83 should be classified as Skin Sens. 1B; H317 (May cause an allergic skin reaction).**

## 10.9 Specific target organ toxicity – repeated exposure (STOT RE)

Not assessed.

### 10.10 Germ cell mutagenicity

Not assessed.

### 10.11 Carcinogenicity

Not assessed.
